The classification of AdS supergravity backgrounds [Freund-Rubin] is a longstanding problem

- Applications include AdS/CFT, string, M-theory, and supergravity compactifications
- Warped, flux compactification to Minkowski space also arise in the limit of infinite AdS radius.
- Aim 1: Count the number of superymmetries preserved by M-theory, IIA and IIB AdS backgrounds
- Aim 2: Present a paradigm which answers the question posed

# M-AdS

The a priori number of supersymmetries preserved by AdS backgrounds in M-theory are

| $AdS_n \times_w M^{11-n}$ | N                      |
|---------------------------|------------------------|
| n = 2                     | 2k, k < 15             |
| <i>n</i> = 3              | 2k, k < 15             |
| n = 4                     | $4k, k \leq 8$         |
| n = 5                     | 8, 16, <mark>24</mark> |
| n = 6                     | 16                     |
| n = 7                     | <b>16</b> , 32         |
| n > 7                     | _                      |

Table: The proof for  $AdS_2 \times_w M^9$  requires the maximum principle. For the rest, no such assumption is necessary. The bounds on *k* arise from the non-existence of supersymmetric solutions with near maximal supersymmetry [Gran, Gutowski, GP] and the classification results of [Figueroa-O'Farril, GP].

| AdS       | Paradigm | Summary |

| 000000000 | 000      | O       |
| IIB-AdS   |          |         |

The a priori number of supersymmetries preserved by IIB AdS backgrounds are

| $AdS_n \times_w M^{10-n}$ | N              |
|---------------------------|----------------|
| n = 2                     | 2k, k < 14     |
| <i>n</i> = 3              | 2k, k < 14     |
| <i>n</i> = 4              | 4k, k < 7      |
| n = 5                     | $8k, k \leq 4$ |
| n = 6                     | 16             |
| n > 7                     | —              |

Table: IIB backgrounds with more than 28 supersymmetries are maximally supersymmetric and there is a unique plane-wave background, up to a local isometry, with 28 supersymmetries.

| AdS       | Paradigm | Summary |
|-----------|----------|---------|
| 000000000 | 000      | O       |
| IIA-AdS   |          |         |

The a priori number of supersymmetries preserved by (massive) IIA AdS backgrounds are

| $AdS_n \times_w M^{10-n}$ | Ν              |
|---------------------------|----------------|
| n = 2                     | 2k, k < 16     |
| <i>n</i> = 3              | 2k, k < 16     |
| n = 4                     | $4k, k \leq 7$ |
| n = 5                     | 8, 16, 24      |
| n = 6, 7                  | 16             |
| n > 7                     | —              |

Table: There are less strict results on the existence of IIA backgrounds with near maximal supersymmetries than those for IIB backgrounds.

| AdS       | Paradigm | Summary |
|-----------|----------|---------|
| 000000000 | 000      | 0       |
|           |          |         |

# Sketching the proof

The warp, flux,  $AdS_n$ , n > 2, backgrounds can be written as

$$ds^{2} = 2du(dr + rh) + A^{2}(dz^{2} + e^{2z/\ell} \sum_{a=1}^{n-3} (dx^{a})^{2}) + ds^{2}(M^{11-n}),$$

with

$$e^+ = du$$
,  $e^- = dr + rh$ ,  $h = -\frac{2}{\ell}dz - 2A^{-1}dA$ ,

A is the warp factor and  $\ell$  the AdS radius.

- Solve the KSEs along the lightcone directions r, u
- solve the KSEs along z and then the remaining  $x^a$  coordinates
- count the multiplicity of Killing spinors

| AdS       | Paradigm | Summary |
|-----------|----------|---------|
| 000000000 | 000      | 0       |
|           |          |         |

The solution of the KSEs along the  $AdS_n$  directions gives

$$\epsilon = \sigma_{+} + \sigma_{-} + e^{-\frac{z}{\ell}}\tau_{+} + e^{\frac{z}{\ell}}\tau_{-}$$
  
$$-\frac{1}{\ell}\left(uA^{-1}\Gamma_{+z}\sigma_{-} + rA^{-1}e^{-\frac{z}{\ell}}\Gamma_{-z}\tau_{+}\right)$$
  
$$+\sum_{a}x^{a}\Gamma_{az}(\tau_{+} + e^{\frac{z}{\ell}}\sigma_{-})\right)$$

where  $\Gamma_{\pm}\sigma_{\pm} = \Gamma_{\pm}\tau_{\pm} = 0$ . The remaining independent KSEs on  $M^{11-n}$  are

$$D_i^{(\pm)}\sigma_{\pm} = 0, \quad D_i^{(\pm)}\tau_{\pm} = 0,$$

and

$$\mathcal{A}^{(\pm)}\sigma_{\pm} = 0 , \quad \mathcal{B}^{(\pm)}\tau_{\pm} = 0 ,$$

► The integration over *z* introduces the new algebraic KSEs above

| AdS        | Paradigm | Summary |
|------------|----------|---------|
| 0000000000 | 000      | 0       |
|            |          |         |

# The counting

To count the multiplicity, it turns out that if  $\sigma_{\pm}$  is a solution, so is

 $\tau_{\pm} = \Gamma_{za} \sigma_{\pm}$ 

and vice-versa

Similarly, if  $\sigma_+, \tau_+$  is a solution, so is

 $\sigma_{-} = A\Gamma_{-}\Gamma_{z}\sigma_{+} , \quad \tau_{-} = A\Gamma_{-}\Gamma_{z}\tau_{+}$ 

and vice-versa.

Furthermore, if  $\sigma_{-}$  is Killing spinor, then

$$\sigma'_{-} = \Gamma_{ab}\sigma_{-} , \quad a < b ,$$

is also a Killing spinor.

The number of supersymmetries are derived by counting the linearly independent solutions

| AdS        | Paradigm | Summary |

| 0000000000 | 000      | 0       |
|            |          |         |

#### New Lichnerowicz theorems

One can establish new Lichnerowicz type theorems as

$$\mathscr{D}^{(\pm)}\sigma_{\pm} = 0 \Longleftrightarrow D_i^{(\pm)}\sigma_{\pm} = 0 , \quad \mathcal{A}^{(\pm)}\sigma_{\pm} = 0 ,$$

These are based on maximum principle formulae

 $D^{2} || A^{-1}\sigma_{-} ||^{2} + nA^{-1}\partial^{i}A\partial_{i} || A^{-1}\sigma_{-} ||^{2} = 2A^{-2} \langle \mathbb{D}_{i}^{(-)}\sigma_{-}, \mathbb{D}^{(-)i}\sigma_{-} \rangle$  $+ 2\frac{9n - 18}{11 - n}A^{-2} || \mathcal{A}^{(-)}\sigma_{-} ||^{2},$ 

where  $\mathbb{D}_i^{(-)} = D_i^{(-)} + \frac{2-n}{11-n}\Gamma_i\mathcal{A}^{(-)}$  and  $\mathscr{D}^{(\pm)} = \Gamma^i \mathbb{D}_i^{(\pm)}$ .

▶ If the solution is smooth, the warp factor *A* is nowhere zero.

| AdS       | Paradigm | Summary |
|-----------|----------|---------|
| 000000000 | 000      | 0       |
|           |          |         |

# New Lichnerowicz theorems

One can establish new Lichnerowicz type theorems as

$$\mathscr{D}^{(\pm)}\sigma_{\pm} = 0 \Longleftrightarrow D^{(\pm)}_i \sigma_{\pm} = 0 \ , \ \ \mathcal{A}^{(\pm)}\sigma_{\pm} = 0 \ ,$$

These are based on maximum principle formulae

$$D^{2} || A^{-1}\sigma_{-} ||^{2} + nA^{-1}\partial^{i}A\partial_{i} || A^{-1}\sigma_{-} ||^{2} = 2A^{-2} \langle \mathbb{D}_{i}^{(-)}\sigma_{-}, \mathbb{D}^{(-)i}\sigma_{-} \rangle + 2\frac{9n - 18}{11 - n}A^{-2} || \mathcal{A}^{(-)}\sigma_{-} ||^{2} ,$$
  
where  $\mathbb{D}_{i}^{(-)} = D_{i}^{(-)} + \frac{2 - n}{11 - n}\Gamma_{i}\mathcal{A}^{(-)}$  and  $\mathscr{D}^{(\pm)} = \Gamma^{i}\mathbb{D}_{i}^{(\pm)}.$ 

▶ If the solution is smooth, the warp factor *A* is nowhere zero.

| AdS       | Paradigm | Summary |
|-----------|----------|---------|
| 000000000 | 000      | 0       |
|           |          |         |

# New Lichnerowicz theorems

One can establish new Lichnerowicz type theorems as

$$\mathscr{D}^{(\pm)}\sigma_{\pm}=0 \Longleftrightarrow D^{(\pm)}_i\sigma_{\pm}=0 \ , \ \ \mathcal{A}^{(\pm)}\sigma_{\pm}=0 \ ,$$

These are based on maximum principle formulae

$$\begin{split} D^2 &\| A^{-1}\sigma_- \|^2 + nA^{-1}\partial^i A \partial_i \| A^{-1}\sigma_- \|^2 = 2A^{-2} \langle \mathbb{D}_i^{(-)}\sigma_-, \mathbb{D}^{(-)i}\sigma_- \rangle \\ &+ 2\frac{9n - 18}{11 - n}A^{-2} \| \mathcal{A}^{(-)}\sigma_- \|^2 , \\ \end{split}$$
  
where  $\mathbb{D}_i^{(-)} = D_i^{(-)} + \frac{2 - n}{11 - n}\Gamma_i \mathcal{A}^{(-)}$  and  $\mathscr{D}^{(\pm)} = \Gamma^i \mathbb{D}_i^{(\pm)}. \end{split}$ 

▶ If the solution is smooth, the warp factor *A* is nowhere zero.

- ► There are new AdS<sub>3</sub> backgrounds preserving 8 supersymmetries with B<sup>4</sup> = ℝ<sup>4</sup>
- ► There are new AdS<sub>3</sub> backgrounds preserving 4 supersymmetries
- There are new Lichnerowicz type of theorems allowing for curvature square terms
- Although there is no classification of all possible backgrounds, there is a clear overview of all possibilities and what equations should be solved to achieve the task.

| AdS<br>000000000 | Paradigm<br>000 | Summary |
|------------------|-----------------|---------|
| Summary          |                 |         |

- ► The fractions of supersymmetry preserved by the most general warped flux AdS backgrounds in M-theory, IIA and IIB supergravities have been determined
- ► In heterotic theory, there are only AdS<sub>3</sub> solutions, the fractions of supersymmetry preserved have been determined as well as the geometry of the backgrounds
- A new class of Lichnerowicz type of theorems for GL connections has been found
- Can M-AdS and type II AdS backgrounds be classified?
